01
Executive Summary
Strategic overview of supply chain risks

Bottom Line

Benchmark filings reviewed reveal that fabless semiconductor companies face significant unprotected financial exposure across multiple supply chain pillars, with liability caps and volume commitment flexibility appearing in only limited subsets of disclosed agreements.

The benchmark filing data across six supply chain pillars indicates a pattern of asymmetric risk allocation favoring suppliers over fabless companies. Disclosures reviewed show that critical protective terms — including liability caps in assembly agreements, guaranteed capacity allocations from foundries despite advance deposits, and royalty exposure limits across IP licensing — surfaced in only subsets of contracts analyzed. Meanwhile, companies consistently commit to financial obligations including deposits, minimum purchases, and ongoing license payments regardless of their operational circumstances. For semiconductor industry professionals entering 2026-Q1, the most immediate implication centers on foundry relationships where the benchmark data reveals a specific vulnerability: companies are committing to advance deposits and minimum purchase requirements while foundries increasingly rely on unconfirmed equipment delivery schedules, creating a cascade of financial risk when upstream tool suppliers face delays.

Key Findings

- **OSAT Liability Gap.** Liability caps protecting companies from assembly yield shortfalls surfaced in only a subset of filings reviewed, leaving financial exposure unlimited when production targets are missed. Startups

should specifically negotiate maximum liability thresholds before committing to assembly partnerships. *[Interpret with caution — directional only]*

- **Foundry Capacity Mismatch.** Guaranteed capacity allocation terms were present across a limited number of agreements despite widespread minimum purchase commitments and advance deposit requirements. Companies face indefinite production delays while payment obligations continue. *[Directional only]*
- **Royalty Stack Risk.** Total royalty caps across multiple IP blocks surfaced in a subset of agreements, creating potential for compounding royalty obligations without ceiling limits. Verify that aggregate royalty exposure is bounded to a maximum percentage of selling price before signing multiple IP deals. *[Directional only]*
- **WFE Cascade Risk.** Foundry capacity commitments often lack backing from confirmed equipment delivery schedules from WFE suppliers. Demand documentation of firm tool delivery timelines before accepting capacity promises tied to financial commitments. *[Directional only]*

Intelligence Suite	What you get with a LegalForensics subscription
Quarterly Benchmark Report	Full baseline per supply chain pillar — clause-level benchmarks, red flags, and negotiation playbooks drawn from SEC EDGAR filings. The authoritative reference for each quarter.
Monthly Intelligence Brief	Incremental update on the 1st of each month. Tracks what shifted since the prior benchmark, what it signals, and one immediate negotiation implication. Designed to be read in under 5 minutes.
Quarterly Scorecard	Quarter-on-quarter movement analysis alongside each benchmark — summarizes what changed in supply chain risk terms and why it matters for your next negotiation.
Contract-Specific Analysis	Upload your own agreements for clause-level risk scoring, missing protection identification, and financial exposure estimates. Available via legalforensics.ai and the LegalForensics MCP connector.
Pricing	**Starter $12K/yr** · **Growth $30K/yr** · **Enterprise $60–90K/yr** · Report-as-a-Service from $2,500

Negotiation Risk Dashboard

Traffic-light assessment by counterparty type

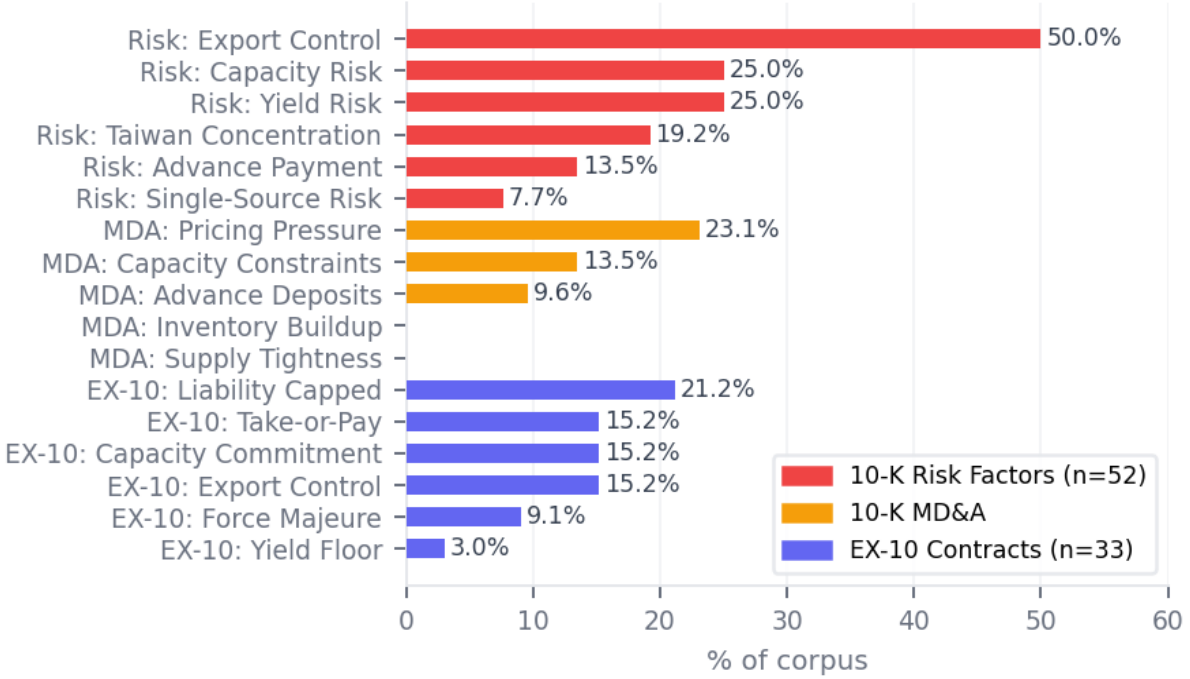
Negotiation Risk Dashboard

OSAT / Assembly & Test	Foundry Supply Agreements	IP Licensing	EDA Tools	Advanced Materials & Substrates	Capital Equipment (WFE)
MODERATE	HIGH RISK	MODERATE	MODERATE	HIGH RISK	MODERATE
Negotiable Terms / Yield and Liability Exposure	Single-Source Dependency / Minimal Startup Leverage	Royalty Stacking / Field-of-Use Restrictions Present	License Lock-in Risk / AI Data Exposure	Constrained Supply / Volume Lock-In Risk	Indirect Exposure / WFE Capacity Constraints

Risk level by counterparty type based on pattern analysis across 154 SEC EDGAR filings. HIGH RISK = minimal startup leverage or single-source dependency. MODERATE = negotiation room exists.

Risk Signal Prevalence

Percentage of corpus companies with each risk signal present in their most recent 10-K or EX-10 material contract filing. Red = 10-K risk factors · Amber = MD&A; · Indigo = contract clause.



Market Average Risk Score — Year on Year

Mean overall risk score (0–10). A rising score indicates more disclosed exposures and/or fewer contractual mitigants.

03

Supply Chain Intelligence Reports

Per-counterparty clause analysis, red flags, and negotiation tactics

Constraint Stacking — Cross-Pillar Risk Interactions

The following risk combinations interact — fixing one in isolation leaves compounding exposure.

Foundry Capacity Loss + Assembly Yield Liability Trap

When your foundry deprioritizes production despite ongoing payments, you are forced to rush limited wafer volumes through assembly. OSAT liability terms show you absorb unlimited financial exposure when rushed assembly yields fall short, creating a cash drain from both unused foundry commitments and assembly failure costs. Break the stack: Negotiate liability caps in OSAT agreements before signing and demand foundry capacity guarantees tied to your payment schedule.

Advanced Materials Volume Lock + Foundry Allocation Uncertainty

SiC substrate suppliers demand advance deposits and minimum volume commitments while your foundry provides no guaranteed capacity allocation — locking you into paying for materials you cannot process. This creates a dual cash drain that can persist 12+ months. Break the stack: Align material volume commitments with confirmed foundry capacity rather than signing independently.

Equipment Delivery Delays + Royalty Payment Acceleration

Foundry capacity promises depend on WFE suppliers delivering tools on schedule, but delays can push production timelines out 12+ months while IP royalty obligations may still trigger on calendar milestones. Break the stack: Tie IP milestone payments to actual production delivery, not calendar dates.

§ 03.1 · OSAT / Assembly & Test

MODERATE *Negotiable Terms / Yield and Liability Exposure*

Filings reviewed indicate OSAT agreements frequently lack defined yield thresholds and liability protections that larger fabless companies secure. Take-or-pay structures surfaced in a subset of agreements, creating locked-in

assembly costs regardless of production outcomes. Advance payment requirements are present across multiple disclosures, though these appear more negotiable than foundry terms. Unlike leading-edge foundries, OSAT vendors operate in a competitive market where startups have meaningful negotiation room. Focus leverage on yield guarantees and liability caps — achievable asks that protect against assembly line failures destroying your cash position.

Contract Red Flags — What to Watch For

- You absorb unlimited financial exposure when assembly yields fall below expectations — liability caps surfaced in only a subset of filings reviewed.
- Assembly production continues billing you even when final yields are unusable — yield floor definitions were absent across multiple agreements analyzed.
- Your capacity gets reallocated to larger customers during high-demand periods.
- You remain locked into minimum assembly volumes even if wafer supply from your foundry stops.
- Advance payments tie up cash before production begins with limited startup-friendly terms.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

Filing data shows OSAT vendors accept yield floors and liability caps more readily than foundries — use their competitive market position to secure production guarantees that protect your cash runway.

Suggested clause language:

```
"Assembly yield shall meet or exceed [X]% of units entering final test. Supplier liability
for yield shortfalls shall not exceed [Y]% of amounts paid for the affected production
run. Buyer may suspend purchase commitments during any period when Supplier cannot meet
agreed turnaround times."
```

Verbatim Contract Clauses — Filed with the SEC

Actual clause excerpts extracted verbatim from material contracts (EX-10 filings) submitted to the U.S. Securities and Exchange Commission. Real, filed, publicly available agreements.

ALGM · 2020-10-13 · *Liability Cap*

```
"NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR CONSEQUENTIAL, SPECIAL OR PUNITIVE DAMAGES OF ANY
NATURE, INCLUDING WITHOUT LIMITATION LOST PROFITS OR REVENUES."
```

§ 03.2 · Foundry Supply Agreements

HIGH RISK *Single-Source Dependency / Minimal Startup Leverage*

Filings reviewed reveal a pattern where startups absorb the majority of operational and financial risk. Single-source foundry dependencies surfaced in a subset of filings, with advance payment requirements and purchase commitments disclosed across several agreements without corresponding capacity guarantees. Taiwan concentration risk appeared in multiple agreements, creating geographic exposure alongside foundry-specific risks. TSMC relationships surfaced with particularly restrictive terms due to market dominance, while specialty foundries showed more flexibility on exit clauses and yield floors. Most critically, startups typically accept unlimited liability exposure for yield shortfalls — a survival risk that can drain an entire funding round if wafer batches fail.

33.3% of corpus companies disclose a dual-source strategy for foundry supply.

Contract Red Flags — What to Watch For

- You pay advance deposits and minimum purchase commitments while the foundry provides no guaranteed capacity allocation — production can be deprioritized indefinitely while payments continue.
- Unlimited liability exposure for yield issues — a single bad wafer lot could exceed your entire Series A funding. Most agreements analyzed lack liability caps.
- Single-source dependencies create total production shutdown risk if the foundry faces capacity constraints or geopolitical disruption.
- Force majeure clauses suspend foundry obligations while keeping your purchase commitments active.
- Exit clauses are often absent or require notice periods exceeding typical startup cash runway.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

Filings suggest specialty foundries offer more negotiation room than TSMC on yield floors and exit terms. Push specialty foundries for mutual commitments — if you guarantee minimum volumes, demand guaranteed capacity allocation in return.

Suggested clause language:

```
"Buyer's purchase commitments are contingent upon Foundry's ability to allocate the
committed wafer capacity during specified timeframes. In the event Foundry cannot fulfill
capacity requirements, Buyer may reduce purchase commitments proportionally without
penalty. Foundry's liability for yield shortfalls shall not exceed amounts paid by Buyer
in the preceding twelve months."
```

Verbatim Contract Clauses — Filed with the SEC

Actual clause excerpts extracted verbatim from material contracts (EX-10 filings) submitted to the U.S. Securities and Exchange Commission. Real, filed, publicly available agreements.

ALGM · 2020-10-13 · *Liability Cap*

```
"The maximum liability of PSL pursuant to this Agreement during any [XXX] month period shall be
limited to [XXX] of the previous [XXX] months overall cumulated sales between PSL and Allegro or
[XXX] Dollars whichever is greater."
```

SITM · 2019-10-23 · *Liability Cap*

```
"In the case where the Resonator's nonconformity causes Buyer's cost, such cost will be compensated
by Seller; provided, however, that such liability will be limited in accordance with Section 19."
```

SKYT · 2021-03-22 · *Termination Rights*

```
"At any time prior to the end of the Due Diligence Period, Buyer may terminate this Agreement, for
any reason or no reason by delivering written notice to Seller."
```

§ 03.3 · IP Licensing

MODERATE *Royalty Stacking / Field-of-Use Restrictions Present*

Industry practice in this category typically involves percentage-based royalty structures ranging from 1–5% of net selling price, with field-of-use restrictions that can limit addressable markets and audit rights that grant IP vendors access to your financial records. Founders negotiating with ARM, CEVA, and similar IP vendors should expect royalty stacking provisions that allow multiple obligations to accumulate on a single chip design. Standard agreements often include broad sublicensing restrictions preventing you from licensing derivative IP to foundry partners — critical if you need to pivot or secure additional revenue during cash-constrained periods.

Contract Red Flags — What to Watch For

- Royalty obligations can compound across multiple IP blocks without caps — verify that total royalty exposure is limited to a maximum percentage of selling price.
- Field-of-use restrictions can block adjacent markets that become critical for survival.
- Audit rights grant IP vendors access to customer lists and pricing data with minimal notice.
- Minimum royalty guarantees lock in annual payments regardless of actual sales performance.
- Sublicensing restrictions prevent you from monetizing derivative IP or partnering with foundries.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

IP vendors typically accept field-of-use modifications for startups targeting niche markets — use your limited initial addressable market as leverage to secure broader rights accommodating future pivots.

Suggested clause language:

```
"Licensed IP may be used in semiconductor products for [specific initial application] and related adjacent applications. Field-of-use restrictions shall not apply to products generating less than $10 million in annual revenue, allowing Company to establish market presence before category limitations take effect."
```

Verbatim Contract Clauses — Filed with the SEC

Actual clause excerpts extracted verbatim from material contracts (EX-10 filings) submitted to the U.S. Securities and Exchange Commission. Real, filed, publicly available agreements.

ON · 2025-09-23 · *Royalty*

```
"All fees to be charged by the Aura Service Entities to onsemi for the Aura Services are as set forth in the Aura Services Schedule."
```

ALGM · 2020-10-13 · *Royalty*

```
"On an annual basis, the Parties will mutually agree upon the fee to be paid to PSI by Sanken and Allegro for the ensuing fiscal year for these designated expenses."
```

SKYT · 2021-04-12 · *Field of Use*

```
"The Licensed Process Technology and the Licensed Backend Technology may be used by Licensee only at the Facility and may not be transferred to, or used in, any other facility."
```

§ 03.4 · EDA Tools

MODERATE *License Lock-in Risk / AI Data Exposure*

EDA agreements present specific risks around license portability, liability exposure, and data rights. Multi-year commitments surfaced in a subset of agreements often without clear termination rights when business circumstances change. AI data usage rights appear loosely defined, with vendors retaining broad permissions to use customer design data for ML improvements. For startups negotiating with Synopsys or Cadence, expect standard terms that favor the vendor but recognize these vendors need your long-term relationship. You have more leverage than you think on seat count scaling, support response times, and data usage boundaries.

Contract Red Flags — What to Watch For

- You remain locked into license payments during funding gaps or pivots — check whether you can suspend or reduce seats without penalty during business disruptions.
- Chip design data feeds vendor AI systems with unclear ownership boundaries.
- Liability for IP violations flows back to you with no cap.
- License transfers between entities become impossible during acquisitions or restructuring.
- Support response times lack guarantees during critical tape-out periods.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

Filing patterns show vendors accept liability caps and data usage restrictions when framed around startup survival needs. Push for graduated payment structures and explicit data boundaries.

Suggested clause language:

```
"Licensee may suspend up to 75% of seat licenses for up to 6 months upon written notice
during funding transitions, with proportional fee reduction. Vendor's use of Customer
design data for AI training requires explicit opt-in consent for each project, and
Customer retains all intellectual property rights in designs created using Licensed
Software."
```

§ 03.5 · Advanced Materials & Substrates

HIGH RISK *Constrained Supply / Volume Lock-In Risk*

Industry practice involves long-term supply agreements with minimum volume commitments, advance deposit requirements ranging from 30–90 days of projected orders, and force majeure clauses that suspend supplier delivery while keeping buyer obligations active. SiC substrate allocation is controlled by a limited number of suppliers who leverage supply constraints to impose unfavorable terms on smaller customers. Founders frequently accept terms they would reject elsewhere — including unlimited liability for yield shortfalls, take-or-pay minimums based on optimistic forecasts, and termination clauses that favor the supplier.

Contract Red Flags — What to Watch For

- You pay deposits and minimum volumes even if your product launch delays by 12+ months.
- Substrate defects halt production while you still owe minimum purchase payments.
- You cannot exit the agreement if a competitor offers better allocation or pricing.
- Yield issues at your foundry create excess substrate inventory you still must purchase.

- Force majeure suspends supplier delivery while your payment obligations continue.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

Suppliers resist startup-friendly terms but will negotiate deposit timing and volume ramp schedules to secure long-term relationships. Push for graduated volume commitments tied to actual production milestones rather than calendar-based minimums.

Suggested clause language:

```
"Minimum purchase volumes shall increase in quarterly increments tied to Buyer's
achievement of production milestones: (i) engineering samples, (ii) customer
qualification, (iii) commercial production launch. Advance deposits shall be credited
against actual orders within 180 days, with unused deposits refundable if Buyer's foundry
experiences yield issues below 85% for the qualified process."
```

Verbatim Contract Clauses — Filed with the SEC

Actual clause excerpts extracted verbatim from material contracts (EX-10 filings) submitted to the U.S. Securities and Exchange Commission. Real, filed, publicly available agreements.

GFS · 2021-10-04 · *Take-or-Pay*

```
"The GF Parties agree to purchase from the Supplier Group a minimum of [***] per calendar year as
set forth in Table 4, below (the "Baseline Purchase Amounts")."
```

§ 03.6 · Capital Equipment (WFE)

MODERATE *Indirect Exposure / WFE Capacity Constraints*

Startups face indirect exposure to wafer fabrication equipment (WFE) vendor dynamics through foundry agreements. While startups do not negotiate directly with ASML, AMAT, or LRCX, their delivery schedules determine when promised foundry capacity actually becomes available. Filings reviewed indicate capacity allocation risks surfaced in a subset of agreements, with foundries making commitments they cannot guarantee due to upstream WFE tool delivery constraints. Your production timeline depends on ASML EUV tool deliveries to your foundry, not just your foundry's willingness to allocate capacity. Ask your foundry to confirm they have firm WFE tool delivery schedules — if they hedge, their timeline commitments are unreliable regardless of contract language.

Contract Red Flags — What to Watch For

- Your foundry promises capacity they cannot deliver because WFE suppliers have not confirmed tool delivery schedules.
- You lock in purchase commitments based on capacity promises that depend on ASML EUV tool deliveries your foundry cannot control.
- Your production timeline collapses if WFE vendors delay deliveries, but contract obligations continue.
- You cannot verify foundry capacity claims because WFE order books are confidential.

Founder Negotiation Playbook

Startup-specific negotiation guidance derived from patterns in filed agreements.

Filing data shows capacity allocation risks are present but foundries resist acknowledging WFE dependencies. Push for specific WFE delivery confirmations and penalty clauses.

Suggested clause language:

```
"Foundry shall provide written confirmation from equipment suppliers of firm delivery
schedules for tools required to support committed capacity allocation. If capacity is
delayed due to equipment supplier delays beyond 90 days from promised delivery, Buyer may
terminate affected purchase commitments without penalty and Foundry shall reimburse
prepaid amounts within 30 days."
```

Verbatim Contract Clauses — Filed with the SEC

Actual clause excerpts extracted verbatim from material contracts (EX-10 filings) submitted to the U.S. Securities and Exchange Commission. Real, filed, publicly available agreements.

ON · 2025-09-23 · *Acceptance Criteria*

```
""Acceptance Criteria" has the meaning set forth in Section 5.2(b). "Acceptance Notice" has the
meaning set forth in Section 5.2(b)."
```

SKYT · 2021-03-22 · *Resale Restriction*

```
"No filing with, and no permit, authorization, consent or approval of any governmental authority is
necessary in connection with the execution of this Agreement."
```

04

Clause Reference Library

The Founder's Shield — protective contract language drawn from filing analysis

The Founder's Shield

The following clauses are derived from gaps identified in the 2026 EDGAR filing analysis. Each addresses a structural imbalance in the current market. Language is indicative — adapt to specific transaction context with counsel.

Foundry: The Reciprocal Commitment Clause

The Gap:

Most foundry agreements require minimum purchase commitments from the buyer but provide no reciprocal guarantee of capacity or yield. This creates an asymmetric obligation where the startup must pay regardless of delivery.

Suggested Language:

```
"If Customer commits to minimum purchase quantities under Section X, Supplier shall
guarantee (i) dedicated monthly capacity allocation of [Y] wafers and (ii) a yield floor
of [Z]% calculated on Customer's reference design. Failure to meet either guarantee
triggers a proportional reduction in Customer's purchase commitment and/or a credit
against future orders."
```

OSAT: The Yield Floor & Alternative Sourcing Clause

The Gap:
The majority of OSAT agreements impose take-or-pay obligations without defining a minimum acceptable yield — meaning the startup pays for broken or non-functional packages at full price.

Suggested Language:

```
"Supplier warrants a minimum yield of [X]%. If yield falls below this floor for two consecutive lots, Buyer may source from alternative providers at Supplier's cost differential, not to exceed a 15% premium over contracted pricing."
```

IP Licensing: The Mutual Liability & Carve-Out Clause

The Gap:
IP licensing agreements routinely cap the licensor's liability while leaving the licensee exposed to unlimited damages from IP defects, indemnification claims, or forced design changes.

Suggested Language:

```
"Each party's total liability shall not exceed the fees paid under this agreement in the twelve months preceding the claim, except for breaches of confidentiality, IP indemnification obligations, or gross negligence. Neither party shall be liable for consequential, indirect, or punitive damages."
```

Supply Chain: The Dual-Source Trigger Clause

The Gap:
Single-source dependencies — particularly Taiwan-concentrated foundry arrangements — expose startups to geopolitical and capacity risk with no contractual exit.

Suggested Language:

```
"Notwithstanding any exclusivity or minimum volume commitments herein, Customer reserves the right to qualify and utilize a secondary geographic source for [Foundry/OSAT] services if the primary facility is subject to export controls, geopolitical instability, or fails to meet Capacity Commitments for more than 30 consecutive days."
```

05

Methodology & Coverage

Data sources, corpus scope, and analytical framework

Methodology & Coverage

Findings in this report are derived from structured analysis of publicly filed material contracts and annual report disclosures submitted to the U.S. Securities and Exchange Commission. Extraction, classification, and scoring are performed using LegalForensics proprietary technology. The output is a dataset of what terms were actually present in real agreements — not modelled, surveyed, or estimated.

Where clause-level data is available, specific language is cited directly from filed agreements. Where the corpus is thin, analysis reflects qualitative patterns from annual report disclosures and industry context. This is

structured intelligence to inform negotiation preparation — not a statistical survey. Filing corpus covers EDGAR submissions from October 2019 to present · 154 filings reviewed.

Reporting Cadence

Report	Frequency	Purpose
Qualitative Intelligence Brief	Quarterly (Jan, Apr, Jul, Oct)	Full baseline — structured intelligence per supply chain pillar. Authoritative reference for the quarter.
Monthly Intelligence Brief	Monthly (1st of each month)	Incremental update — tracks movements since prior benchmark. Designed to be read in under 5 minutes.
Quarterly Scorecard	Quarterly (alongside Benchmark)	Quarter-on-quarter movement analysis — summarizes what changed since the previous quarter.

Supply Chain Counterparty Coverage

Panel of approximately 50 listed fabless semiconductor companies. Updated continuously as new filings are submitted.

Counterparty Type	Representative Vendors	Negotiation Zone	What We Look For
Foundry	TSM, GFS, UMC, TSEM, SKYT	High (specialty) / Low (TSMC)	Yield floors, capacity guarantees, take-or-pay asymmetry, force majeure
OSAT / Assembly & Test	AMKR, ASX, IMOS, KYEC	Medium	Yield floor definitions, take-or-pay minimums, re-test rights, liability caps
IP Licensing	ARM, RMBS, CEVA	Medium–High	Royalty structures, termination rights, AI data rights, liability carve-outs
EDA Tools	SNPS, CDNS	Strategic	IP indemnification, AI training data rights, license portability, liability caps
Capital Equipment	ASML, AMAT, LRCX, KLAC	Context only	EUV availability signals advanced node capacity constraints
Advanced Materials	WOLF	Medium	Advance payment structures, capacity reservation terms, SiC supply concentration

CMOS Silicon vs. Compound Semiconductor — Why It Matters

Most semiconductor legal templates are written for standard CMOS silicon. Applying them to compound semiconductor foundries (InP, GaAs, SiC) introduces material contractual risk.

Dimension	CMOS Silicon	Compound Semiconductor
Yield	Mature process, predictable	Brittle materials — wide variance; yield floors are non-negotiable
IP Ownership	Standard library / PDK terms	Manufacturing recipe often claimed by foundry — red flag
Contract Template	Volume tiers, take-or-pay	MPW slots, development milestones, success fees

Primary Risk	Capacity allocation	Yield lottery + joint IP capture by foundry
Negotiation Approach	Reciprocal capacity clause	Yield floor + IP boundary clause from Day 1

06

About LegalForensics

Platform capabilities and contact information

About LegalForensics

LegalForensics applies proprietary extraction and classification technology to material contracts publicly filed with the SEC. The output is a structured dataset of what terms were actually present in real semiconductor supply chain agreements — built from the observable public filing corpus, not surveys or estimates. By bridging the gap between historical prevalence and future negotiation, we empower founders to secure the Shield clauses necessary to protect their path to production.

This report surfaces patterns in that data. Where a term shows high prevalence — such as unlimited liability exposure or single-source dependency — it reflects what was found in past filings. The value is diagnostic: identifying where structural risk has consistently appeared in supply chain agreements facing fabless companies, so that founders and investors can approach negotiations with an evidence base rather than assumptions.
