PROCUREMENT INTELLIGENCE · DESIGN-IN VISIBILITY

Know your supplier's financial and competitive position.

Before you design in or negotiate.

Grounded in what suppliers disclose in their own filings — not what they present in their roadmaps.

Semitrical

Supplier intelligence for semiconductor procurement

contact@semitrical.ai · semitrical.ai

JEDEC Automotive Electronics Forum

Santa Clara · September 17, 2026

semitrical.ai/suppliers

Procurement intelligence **with design-in visibility.**

Semitrical surfaces what semiconductor suppliers disclose in their own filings — so procurement teams negotiate with the same depth the supplier's commercial team already has, and engineering teams make design-in decisions with visibility into whether that supplier is still investing in the technology their programme depends on.

WHAT SEMITRICAL DOES

We read every filing, earnings transcript, and investor presentation across our supplier corpus and translate it into **negotiation intelligence, supply resilience signals, and technology investment visibility** — for the people who design components in and the people who then have to buy them. Engineering and procurement are making the same decision from opposite ends of the timeline. Semitrical gives both teams the same picture.

ABOUT THIS DOCUMENT

Every page that follows is a sample of platform output — what Semitrical produces from supplier filings, earnings transcripts, and investor presentations, combined where relevant with a buyer's own spend data. The intelligence shown is real, drawn from the corpus as at September 2026. The spend figures on page 7 are illustrative.

SAMPLE OUTPUTS — PAGES 3 TO 7

WHAT THE PLATFORM SURFACES — FIVE OUTPUT TYPES SHOWN IN THIS DOCUMENT

pg 3 CAPITAL INVESTMENT SIGNAL Supplier plant investment vs. depreciation Which suppliers are growing their plant base and which are letting it shrink — the single ratio that points forward on part availability.	pg 4 TECHNOLOGY INVESTMENT SIGNAL · MEMORY Memory: who is funding the next node LPDDR6, UFS, HBM. Which suppliers are investing at scale for automotive-grade supply — and which are harvesting current capacity.	pg 5 TECHNOLOGY INVESTMENT SIGNAL · ANALOG Analog & Power: technology shifts in the filings SiC, GaN, SDV/zonal. What supplier filings and transcripts say about technology priorities — and where capacity is being redirected.
pg 6 NEGOTIATION INTELLIGENCE Power semiconductor leverage by product SiC vs IGBT. Three suppliers, three financial positions, three very different negotiating conversations — grounded in last quarter's filings.	pg 7 SPEND + CORPUS OUTPUT Supplier leverage scores and part-level posture What the platform produces when corpus intelligence meets a buyer's actual spend data — leverage scores, negotiation posture, and watch triggers per part.	pg 8 GET STARTED Supplier diagnostic Names only. No contract. No NDA. We run your shortlisted suppliers through the corpus and deliver a structured report the same week.

WHO USES IT

ENGINEERING TEAMS

Is this supplier still investing in the technology my programme depends on?

Before a design-in is finalised, know whether the supplier is funding the next node, maintaining capacity for this product line, and whether their strategic roadmap still treats this technology as a priority — or is quietly moving capital elsewhere.

PROCUREMENT TEAMS

What does their financial position say about my negotiating leverage — right now?

When a supplier sends a price increase letter, their last two earnings calls already say whether to accept it, push back, or use it to secure supply commitments. Semitrical reads the filings so your team walks in with the same depth the supplier's commercial team already has.

SAMPLE OUTPUT · CAPITAL INVESTMENT SIGNAL

The design-in **is** the procurement decision.

When engineering commits to a part, procurement inherits the supplier behind it — their financial health, their technology priorities, and their ability to supply that part for 10 to 15 years. The roadmap describes what a supplier intends to build. The filing tells you whether the capital is there to build it, and whether this technology is still where they are putting it.

TWO DOCUMENTS. ONE SUPPLIER. VERY DIFFERENT INFORMATION.

The roadmap

Nodes, densities, capacity plans, product generations. Presented at every supplier review. Describes what they intend to build. Does not say whether the investment is funded — or whether this product line is still a strategic priority.

The filing

Capital spending relative to what the existing plant costs to maintain. Free cash flow. Management commentary on which segments and technologies they are prioritising. Filed with regulators every quarter. Rarely opened by engineering or procurement.

CAPITAL SPENDING VS. PLANT DEPRECIATION — ONE RATIO THAT POINTS FORWARD

What each supplier is doing with their plant base — FY2025

Think of this as a maintenance dial. At 1.0× a supplier is spending exactly enough to replace what wears out — their factory stays the same size. Above 1.0× they are adding capacity or upgrading to a newer process. Below 1.0× their factory is gradually shrinking. A supplier spending below replacement for several consecutive years is signalling something about the long-term availability of parts from that plant.

MEMORY SUPPLIERS

ANALOG / POWER SUPPLIERS

Source: company annual filings FY2025. Each company at its own latest fiscal year-end. Samsung excluded — semiconductor division capex not separately reported. Kioxia: D&A used as proxy.

Below 1.0× is the clearer signal. A plant base shrinking faster than it is replaced has no positive interpretation for a buyer with a 15-year programme. **Above 1.0× is more nuanced** — it can be new capacity, a process upgrade, or the same plant rebuilt on a newer node. The ratio shows direction. The transcript tells you which.

SAMPLE OUTPUT · TECHNOLOGY INVESTMENT SIGNAL · MEMORY

Memory: which suppliers are funding the next node

LPDDR6 is in sampling. LPDDR5X is in automotive qualification. UFS 4.1 is ramping. The engineering question is not which technology is next — it is which suppliers are investing to build it at automotive grade, at scale, for the decade your programme needs. The filings separate the two groups clearly.

DRAM CONTENT — WHAT THE AUTONOMY TRANSITION MEANS IN VOLUME TERMS

DRAM requirement by vehicle autonomy level

Source: Micron Q2 FY26 investor presentation, Mar 18 2026. [Micron Q2 FY26](#)

SUPPLIER SIGNALS — FILINGS AND TRANSCRIPTS Q3 FY25-Q2 FY26

Micron

LPDDR · UFS · HBM · Auto DRAM

Capex ÷ plant dep **1.92×**
Auto revenue **Record Q2 FY26**

Sampling 1y LPDDR6 to OEM and ecosystem partners. First automotive-grade 1y LPDDR5 DRAM shipped. ASIL-rated LPDDR5X and UFS 4.1 have secured "billions of dollars in design wins." Investing in Manassas VA fab for long-lifecycle supply. [Micron Q1/Q2 FY26](#)

SK Hynix

LPDDR · HBM · NAND

Capex ÷ plant dep **2.17×**
FCF margin FY25 **26.6%**

Completed development of industry's first 1c-nm LPDDR6 in Q1 FY26. 33% faster data processing and >20% better power efficiency vs LPDDR5X. Full-scale supply planned H2 2026. CapEx increasing significantly in 2026 vs 2025. [Hynix Q1 FY26](#)

Kioxia

NAND · UFS · SSD

Capex % of revenue **12.1% (FY25)**
vs. FY22 peak **Was 39.8%**

Revenue at record high FY25 but capital spending at its lowest share in six years. 8th-gen BiCS FLASH in high-volume production. 10th-gen in development. UFS for automotive a stated strategic focus. FY26 gross capex guided 450 billion yen. [Kioxia Q3/Q4 FY25 · Q1 FY26](#)

Nanya

Specialty DRAM · DDR4

Capex ÷ plant dep **0.96×**
Revenue vs own peak **-30.3%**

Revenue 30.3% below its own six-year peak in the same quarters three other memory makers set records. Spending at replacement level only. FCF margin reached -64.7% in 2023. Same country exposure as Winbond — both Taiwan-based. [Nanya filings FY25](#)

Winbond

NOR Flash · SLC NAND · DRAM

Capex ÷ plant dep **0.53×**
Revenue vs own peak **-19.5%**

Capital spending hit 4.59× depreciation in 2022 then fell to 0.53× — about half of replacement. Three consecutive negative FCF years. R&D at six-year high — reads as a completed build. Holds #1 NOR Flash, #3 SLC NAND position. [Winbond filings FY25](#)

KEY SIGNAL — MICRON Q3 FY26 INVESTOR TRANSCRIPT

"Many projects and platforms and several customers are going to just end up using one or two HBM suppliers... HBM we see is going to become a two-supplier market, and oftentimes, just a single-sourced opportunity. It is not just true for HBM."

Sumit Sadana, EVP and Chief Business Officer, Micron · Q3 FY26 investor transcript [Micron Q3 FY26](#)

The co-engineering required for next-generation LPDDR6 and advanced memory at automotive grade means supplier selection increasingly becomes a single or dual-source commitment for the programme's life. The filing tells you whether the supplier you are co-engineering with is still funding the node you need.

SAMPLE OUTPUT · TECHNOLOGY INVESTMENT SIGNAL · ANALOG & POWER

Analog & Power: technology shifts already in the filings

SiC is replacing IGBT in traction inverters. GaN is entering automotive for the first time. The SDV/zonal architecture is rewriting the MCU BOM. These are not roadmap statements — they are production and design-win disclosures in filings from the last two quarters, with capital spending and management commentary that shows which suppliers are still behind the technology and which are redirecting investment elsewhere.

SEMICONDUCTOR CONTENT PER CAR — THE SHIFT ALREADY UNDER WAY

TECHNOLOGY TRANSITIONS — PRODUCTION AND QUALIFICATION DISCLOSURES, LAST TWO QUARTERS

WHAT IS SHIPPING OR IN QUALIFICATION — SOURCED FROM FILINGS AND TRANSCRIPTS		
Si IGBT	→	SiC MOSFET
		IFX SiC trench gives 30% more die per wafer vs planar. CoolSiC Gen2 rated 175°C. Design wins confirmed in traction inverter, OBC, DC-DC. IFX Q1/Q2 FY26
Si MOSFET	→	GaN (auto)
		IFX launched first AEC-Q101-qualified GaN: CoolGaN 100V G1. Targets 48V/12V DC-DC, zone control, OBC, Class D audio. IFX Q1 FY26
Domain ECU	→	Zonal / Central
		IFX design win for zone controller combining AURIX MCU, PMICs, CoolFET with a leading carmaker. BoM potential ~\$500 per E/E architecture. IFX Q3 FY26
SiC (auto)	→	AI datacenter
		STM raised FY26 datacenter guidance to "well above \$2 billion." AWS multi-year engagement covers SiC power. Catania SiC capacity being allocated. STM Q2 FY26 · July ppt

IFX — AI POWER SUPPLY-LIMITED

IFX stated its €1.5B AI power revenue target for FY26 is "supply-limited, not capped by demand." Dresden M4 — largest intelligent power fab globally — opened July 2026 but AI programmes are filling capacity. Automotive buyers should initiate LTA discussions now. [IFX Q1 FY26](#)

STM — DUAL SUPPLY CHAIN NOW OPERATING

First STM32 wafers produced at Huahong (China) delivered to Chinese customers in Q1 FY26. STM is operating parallel China-for-China and global supply chains. Verify which supply chain your part numbers are on. [STM Q1 FY26](#)

⚠ DESIGN-IN RISK: SiC FOR AUTOMOTIVE 2027+

Both IFX and STM — the two largest automotive SiC suppliers — are allocating fab capacity to AI datacenter programmes simultaneously with automotive ramps. STM's Catania SiC capacity is partially committed to its AWS engagement. IFX's Kulim 3 fills first with AI-related programmes. Engineers designing SiC into OBC, DC-DC, or traction inverter platforms targeting 2027+ production should confirm allocation status with procurement now — not at SOP minus 12 months. [STM Q2 FY26 · IFX Q1 FY26](#)

SAMPLE OUTPUT · NEGOTIATION INTELLIGENCE

Power semiconductors: **your leverage depends on which product you are buying from which supplier.**

All three suppliers sent price increase letters in 2026. The financial justification behind each letter is very different — and so is the right response. SiC and IGBT are structurally bifurcated markets sitting inside the same supplier relationship.

FINANCIAL POSITION — Q2 2026 · SOURCED FROM COMPANY FILINGS AND EARNINGS TRANSCRIPTS

	Infineon Broadest portfolio · Kulim SiC ramping	STMicro P&D loss-making · Catania SiC ramp	onsemi Exited commodity · Differentiation focus
Operating margin	~20% Segment result target · recovering	-21.4% P&D segment · loss-making Q2 FY26	20.8% Non-GAAP · expanding +170bps Q/Q
LTM free cash flow margin	~9-10% Solid · Dresden M4 capex normalising	~2-3% Minimal · factory underloaded	24.2% Strongest of the three · 100% returned to shareholders
CapEx intensity	~12% Kulim 3 + Dresden M4 investment	~17% Declining toward replacement · build complete	5.7% Sharply reduced · no new fabs · brownfield only
Price increase status	July 2026 announced Broad portfolio · AI power fully allocated	Implementing Margin recovery driven · P&D needs volume	Second round "Surgical" where allocation exists · cost pass-through

BUYER LEVERAGE BY PRODUCT CATEGORY — HIGHER SCORE = HIGHER BUYER LEVERAGE

Product category	INFINEON	STMICRO	ONSEMI
SiC MOSFET Traction inverter · OBC · DC-DC · AI datacenter	• Low leverage Supply-limited. AI power absorbing Kulim 3 capacity. Initiate LTA now.	◆ Medium — declining AWS engagement absorbing Catania SiC. Get written 2027 allocation commitments now.	• Low leverage CEO: "we exit commodity." China SiC +60-70% YoY. Lead times extending.
IGBT / Si Power Legacy drivetrain · Industrial drives · General power	◆ Moderate leverage IFX deprioritising Si drivetrain as SiC displaces. Use in pricing renewal.	▲ Highest leverage P&D loss-making. Factory needs volume. Best window across all three.	◆ Some leverage Not exiting IGBT. Pricing actions are cost pass-through, not margin- driven.

WHAT MANAGEMENT SAID — VERBATIM FROM EARNINGS TRANSCRIPTS

INFINEON · Q1 FY26 EARNINGS CALL "Our AI power target of €1.5 billion is supply-limited — it is not capped by demand." IFX management · Q1 FY26 transcript	STMICRO · JULY 2026 INVESTOR PPT "Data center revenues are now expected well above \$2 billion in 2026" — raised from \$1B+ guided in Q1 FY26. STM management · July 2026 investor ppt	ONSEMI · DEUTSCHE BANK CONF. Q2 FY26 "If it's a multi-source product, the margin is not exciting — that's the business we actually exited. We win where our products provide differentiation." Hassane El-Khoury, CEO · Deutsche Bank conf. Q2 FY26
--	--	---

THE PROCUREMENT READ

The power semiconductor market is structurally bifurcated. **SiC is supply-constrained across all three suppliers** — limited buyer leverage, price increases being implemented, lead times extending at onsemi. **Legacy IGBT and Si power has genuine negotiation room** — particularly at STM where P&D is loss-making and the factory needs volume. All three are implementing price increases but the financial justification varies dramatically. **Knowing which story you are negotiating against changes the conversation entirely.** IFX
Q1/Q2 FY26 · STM Q2 FY26 · July ppt · onsemi Q2 FY26 transcript · Deutsche Bank conf.

SAMPLE OUTPUT · SPEND + CORPUS COMBINED

When engineering commits, here is what procurement sees.

Semitrical combines the supplier corpus with a buyer's own spend data. The output connects design-in decisions to negotiation posture, pricing signals, and supplier financial health in one place.

SUPPLIER LEVERAGE INDEX – DERIVED FROM FINANCIAL SIGNALS AND MANAGEMENT COMMENTARY IN THE CORPUS · HIGHER SCORE = HIGHER BUYER LEVERAGE

↓ Part numbers, spend figures, and ASP changes below are illustrative sample data. Leverage scores and supplier signals above are sourced directly from the corpus.

PART-LEVEL VIEW – CORPUS INTELLIGENCE COMBINED WITH BUYER SPEND DATA

Part / Application	Supplier	FY26 Spend	Contracted Δ ASP	Alt Supplier	Posture
STPMIC25 MPU Power · Industrial	STM	\$2.80M	-7.9%	TI TPS6594 ✓	Push further
STM32H7 Instrument Cluster · Auto	STM	\$3.35M	-8.0%	NXP S32K3 (in prog)	Lock in + volume
TPS62913 Buck Converter · Auto	TI	\$4.51M	-3.5%	STM ST1S12 ✓	Multi-year LTA now
SCTW100N65 OBC / DC-DC SiC · Auto	STM	\$3.51M	-7.1%	IFX IMBG65R ✓	Secure 2027 allocation
TC375 AURIX Powertrain ECU · Auto	IFX	\$4.29M	Flat	NXP S32K3 (not started)	Resist increases
IPT015N10N5 Motor Drive MOSFET · Auto	IFX	\$8.78M	-3.6%	STM STL160N ✓	Hold – IFX deprioritising Si

SAMPLE RECOMMENDATION – STM POWER & DISCRETE

PRICING & TERMS · GROUNDED IN FINANCIAL SIGNALS AND MANAGEMENT COMMENTARY FROM THE CORPUS

STM's Power & Discrete segment operated at -21.4% operating margin in Q2 FY26 [STM Q2 FY26 results](#) and free cash margin was approximately 2.2%. The segment needs volume. STM has already moved -8% on MCU lines to retain volume. Use the NXP S32K3 qualification in progress as a credible walk-away signal. On SiC, request written 2027 allocation commitments before STM's datacenter revenue guidance rises further — at that point their Catania capacity posture changes. [STM July 2026 investor ppt](#)

🔔 Watch trigger: STM gross margin above 37% GAAP removes the leverage – guided ~34.8% GAAP in Q2 FY26

Semitrical

REMOVING ASYMMETRY FROM CHIP DEALS

Before your next design-in review, ask us for a read.

Supplier names only. No contract. No NDA.

We read every filing, every earnings transcript, and every investor presentation across our supplier corpus — and translate it for the people who design components in, and the people who then have to buy them.

WHAT YOU GET

Supplier Portfolio Diagnostic

Your shortlisted or current suppliers. Their last two quarters of filings. What it means for technology longevity, supply continuity, and pricing posture — combined with your spend data if you share it. Delivered as a structured report your engineering and procurement teams can use the same week.
